Submission to Applied Stochastic Models in Business and Industry

Hard to Beat: Historical Rules versus Conditional Quantile Models for Peak Net-Position Limits

Dear Editors,

Matched foreign exchange (FX) gains depend on the reference; longer validation reduces weekly median losses yet leaves large adverse cases; illustrative cost rankings depend on reserve and breach charges.

The paper fits your journal's scope of "stochastic modelling, data analysis and their applications in business, finance". It compares mature conditional methods and historical reports for sampled dealer-position peaks, retaining adverse results and retrospective qualifications.

Your author guidelines consider previously available preprints for review and request final-publication links when available. We disclose the GitHub working versions, including revision branches and PRs recorded in the public-version inventory, together with code and aggregate results. These are working versions of the same retrospective study; source-rights conditions and excluded inputs are documented in the manuscript. [AUTHOR TO CONFIRM OTHER VERSIONS, ALL-AUTHOR APPROVAL, EXCLUSIVE SUBMISSION AND DATA-SHARING PERMISSIONS].

Sincerely,

[TO BE COMPLETED BY AUTHOR]
