Submission: Hard to Beat: Historical Rules versus Conditional Quantile Models for Peak Net-Position Limits

Dear Editors,

Matched FX gains remain reference-dependent, weekly historical controls remain competitive, and CFTC expanded regression is generally cheaper under higher reserve and lower fixed-breach charges, with local exceptions.

The paper suits Journal of Forecasting through its comparison of complete forecast procedures under matched histories and update schedules. Calibrated simulations link large short-history losses to narrow penalty menus; the registered switching increment is unsupported. Model confidence sets and cost-preference regions connect forecast evaluation to limit validation across related aggregate series. The methods are established, and the evidence remains retrospective. The accompanying materials provide native sources, complete adverse and unavailable results, official CFTC source records and versioned code and public aggregate results. Restricted FX observations and private prediction vectors remain excluded; author details and declarations await completion in the supplied templates.

Sincerely,

[TO BE COMPLETED BY AUTHOR]
